

**Pyramid Point**

Aspen, CO  
Summer 2007  
Geofoam Slope Stabilization  
28,000 Cubic Feet

**Application:**

28,000 cubic feet of EPS 19 Geofoam was installed as a slope stabilization material at Pyramid Point, a new housing development, in Aspen, Colorado.

**Project Details:**

**Architect:**

Jamie Brewster  
Brewster McLeod

In summer 2007, engineers and contractors of the Pyramid Point project in Aspen, Colorado required void fill that provided slope stabilization for six custom homes.

**Contractor:**

Vincent Coghlan  
Richard Wax & Associates

The entire site in which the homes were built is on a steep mountain slope. This meant engineers needed to reduce lateral pressure on the home's walls and stabilize the buildings on the hillside.

Geofoam was selected for its high compressive strength. The EPS Geofoam blocks were trimmed and cut to 6 ft x 10 ft sizes for this project.
