

**South Tahoe Refuse Co.**

South Lake Tahoe, CA  
Fall 2008  
SIPs Roof Panels  
37,000 Square Feet

**Application:**

37,000 square feet of R-Control Structural Insulated Panels (SIPS) framed the roof of the new South Tahoe Refuse Company in South Lake Tahoe, California.

**Project Details:**

In Spring 2008, construction began on a new facility that is dedicated to increasing recycling for the South Lake Tahoe communities through its organic and new green waste collection. The building was designed to meet LEED certification and increase material handling around the existing facility.

Structural Insulated Panels were specified by the architect for its energy efficiency and because it is a recommended component of LEED certified projects.

The 6 ½ SIP roof panels also offered design flexibility, speed of construction, and resulted in less waste on the jobsite.
